# 1. Introduction

Avensons SalesGuard is a web-based decision-support tool that reviews the daily outstanding report and monthly sales data uploaded by Avensons, and automatically applies a set of business rules to surface billing and collection issues that would otherwise require manual review.

SalesGuard does not replace the FMCG company's billing or ERP system. It sits on top of the data that system already produces and adds:

- Automatic detection of rule violations across every outlet and salesman.
- Role-based views for managers, salespeople, and system administrators.
- Sortable, filterable, exportable lists for each type of issue.
- A running record of collections and salesperson performance.

> **Scope:** *SalesGuard is a monitoring and decision-support tool. It does not create invoices, process payments, or replace the outstanding report as the source of truth.*

## Who uses SalesGuard

| Role | What they use it for |
|---|---|
| Super Admin | Creates and manages user accounts (managers and salespeople), and views system-wide totals. |
| Manager | Uploads reports, reviews flagged lists, tunes rule thresholds, and monitors salesman performance. |
| Salesperson | Views their own outlets, dashboard, and collection history; marks amounts as collected; adds notes on flagged invoices. |

## 2. Logging In

All users sign in from the same starting screen.

1. Open SalesGuard in your browser.
2. Select your role: Super Admin, Manager, or Salesperson.
3. Enter your registered email ID and password, then select Log In.

If you selected a role that does not match your account, you will see a message asking you to pick the correct role. This does not mean your password was wrong.

### Forgot Password

4. Select Forgot Password? on the login screen.
5. Enter your registered email ID and submit.
6. If the email is registered, a reset link will be sent to it.
7. Open the link and set a new password.

> **Note:** *For security, the system shows the same confirmation message whether or not the email is registered. This does not confirm whether an account exists for that address.*

# 3. Manager Guide

After logging in, managers land on the Upload screen. The top navigation bar provides access to Upload, Dashboard, Configuration, and Salesmen. The left sidebar lists every business rule together with its current flag count, and clicking a rule opens its full list.

## 3.1 Uploading Reports

SalesGuard accepts two kinds of files:

- Daily outstanding report - the standard “Outstanding with Outlet” export. This is the primary source of outlet, salesman, and invoice data, and is what most rules are checked against.
- Monthly sales - the “Sales Register - Itemwise” export. This builds the sales history that a few rules (Stock-Dumping Alert and Sudden Drop in Sales) compare against.

To load a report:

8. Go to Upload.
9. Select Choose File and pick the Excel file.
10. Select the Location this file belongs to.
11. Select the Report type: Daily outstanding or Monthly sales.
12. Optionally set the As on date. If left blank, SalesGuard reads the date printed at the top of the sheet (for a monthly file, the 1st of the selected month is used as the reference date).
13. Select Load and check.

For a daily outstanding upload, SalesGuard automatically runs every enabled rule immediately after loading and shows a summary of documents, outlets, salesmen, and flags raised. A monthly sales upload does not trigger a rule check by itself, since it only adds sales history; rules are evaluated the next time a daily report is loaded or rechecked.

> **Replacing a report:** *Loading a file for a date and type that has already been loaded replaces the earlier version - it does not create a duplicate.*

### Loaded Reports and Rule Checks

The Loaded Reports table lists every file that has been uploaded, with its date, type, source file name, and row count. Selecting the ··· menu on a row offers:

- Show - opens the Salesmen view for that report's rule check (daily reports) or that month's sales performance (monthly reports).
- Delete - removes the report and any rule check results tied to it. This cannot be undone. Deleting a monthly report removes its upload record only; the sales figures it contributed remain part of the sales history used by other rules.

The Rule Checks table on the right lists each completed check with its status, how many records were in scope, and how many flags were raised. Selecting a successful row opens the Dashboard for that check.

### 3.2 Managing Locations

Every uploaded report is tagged with a location (for example, Coimbatore (CBE), Chennai, Madurai, Salem, or Trichy) at the time it is uploaded. Selecting Manage locations on the Upload screen lets a manager add a new location or remove one that is no longer needed.

> **Note:** *A location can only be removed if at least one other location remains in the list.*

### 3.3 The Dashboard

The Dashboard summarises the most recent rule check: total amount overdue, number of outlets and salesmen affected, and a breakdown by rule. Selecting a rule from the sidebar list or the dashboard opens its full flagged list.

A location selector is available in the top-right of the screen, next to the account menu. Choosing a specific location restricts the Dashboard, flagged lists, and Salesmen view to that location only. Choosing All locations combines results across every location that has a completed rule check.

### 3.4 Reviewing a Flagged List

Selecting any rule from the sidebar opens its list of flagged records. Each list provides:

- A search box to find a specific bill number.
- Column filters to narrow results by outlet name or salesman name.
- Sortable columns - selecting a column heading toggles ascending and descending order.
- A Why it is flagged column explaining, in plain language, why each record was included.
- Print and Export to Excel (CSV) options for sharing the list outside SalesGuard.

While viewing a flagged list, the top navigation collapses to a single Home button. Selecting Home returns to the Dashboard.

Selecting any row opens a detail view for that outlet, showing its full invoice history and any notes recorded against it.

### 3.5 Salesmen Overview

The Salesmen screen lists every salesman together with their flag count, number of outlets involved, and total amount at risk. This same screen also shows monthly sales performance - total sales, invoice count, and comparison to each salesman's own 3-month average - when opened from a monthly report's Show action.

### 3.6 Configuration (Rule Thresholds)

Every numeric threshold used by a rule - for example, how many days overdue counts as high risk, or what percentage above average counts as stock-dumping - can be changed from the Configuration screen without any code change. Adjusting a threshold and selecting Save thresholds takes effect the next time rules are checked.

> **Caution:** *Lowering a threshold will generally increase the number of flags raised, and raising it will decrease them. Review a threshold change against a recent rule check before relying on it.*

### 3.7 Filtering by Location

As described in section 3.3, the location selector applies across the Dashboard, every flagged list, the Salesmen view, and the exported CSV file. Selecting Show from a specific report's row menu on the Upload screen always opens that exact report's results, regardless of which location is currently selected in the filter.

## 4. Business Rules Reference

The following fourteen rules are active in SalesGuard. Every threshold shown is a default and can be adjusted from Configuration.

| Code | Rule | What it checks |
|---|---|---|
| R01 | DBN Overdue Alert | A bounced cheque or debit note has remained pending beyond the permitted number of days (14 days by default). |
| R02 | Same-Salesman Double Bill | The same salesman has billed this outlet again while an earlier invoice remains unpaid. |
| R03 | Cross-Salesman Credit Block | Another salesman's invoice for the same outlet is significantly overdue. This flags the account; it does not block further billing. |
| R04 | Stock-Dumping Alert | The current invoice amount is substantially higher than the outlet's normal purchasing pattern (3-month average). Requires monthly sales data. |
| R05 | Underperforming Salesman (Collection) | One salesman has collected and re-billed the outlet while a colleague's earlier invoice at the same outlet remains uncollected. |
| R06 | Lost Potential Sale (Category Coverage) | The outlet recently purchased one product category, but an associated category was not billed. |
| R07 | Low Outstanding Ratio | The outlet has paid nearly the full invoice amount, leaving a small balance worth reviewing. |
| R08 | Chronic Default Customer | Every salesman servicing this outlet has exactly one outstanding invoice, and all remain unpaid. |
| R09 | Over-30-Day Invoice List | Standard credit-control list of invoices overdue by more than 30 days. |
| R14 | High Uncollected Ratio (80-100%) | For this outlet-salesman pair, the invoice is more than 30 days old and 80-100% of it remains uncollected. |
| R15 | Dormant Customer Alert | This outlet was previously active but has had no billing from any salesman in recent weeks. |
| R16 | Sudden Drop in Sales | This month's sales are significantly below the outlet's own 3-month average. Requires monthly sales data. |
| R17 | Beat Coverage Gap | This outlet received no billing while the rest of its beat was serviced. |
| R18 | New Customer Risk | This is a newly acquired outlet (first billed within 60 days) that already has an overdue balance. |

## A note on data-dependent rules

Two rules - Stock-Dumping Alert and Sudden Drop in Sales - compare current billing against an outlet's own sales history. Until real monthly sales data has been uploaded for an outlet, these rules estimate that history from unpaid invoices in the outstanding file; the estimate is replaced automatically once a real monthly sales file covering that outlet is loaded.

Three rules - Dormant Customer Alert, Beat Coverage Gap, and New Customer Risk - rely on the earliest date an outlet has ever been seen in an uploaded report, and become more accurate as more daily reports are loaded over time. New Customer Risk in particular does not run until at least two daily reports have been loaded, since a single report cannot distinguish a genuinely new outlet from one that is simply new to SalesGuard's records.

## 5. Salesperson App Guide

Salespeople sign in with the Salesperson role and see only their own outlets and figures.

### Dashboard

Shows the salesperson's total amount due, overdue amount, number of high-risk and good outlets, a breakdown of flags by rule, a list of priority outlets to follow up on, and a My Performance card comparing this month's collections to last month's.

### My Shops

Lists every outlet assigned to the salesperson, with outstanding balance, days overdue, and a status indicator (for example, High Due or Colleague Visited). Selecting an outlet opens its full invoice detail, including any explanation already recorded.

### Collections

A salesperson can record a payment as collected against one or more invoices for an outlet, noting the amount and payment mode (cash, UPI, or cheque). Recorded collections appear in Collection History with running totals.

> **Important:** *Marking an amount as collected records it in SalesGuard for tracking and performance purposes. It does not reduce the outstanding balance shown from the FMCG company's own report - that balance updates only when the next outstanding report is uploaded and reflects the payment.*

### Notifications

System and manager notifications relevant to the salesperson appear here and can be marked as read.

### Profile

Shows the salesperson's name, role, and location.

# 6. Super Admin Guide

The Super Admin role manages user accounts across the system and is not involved in day-to-day rule review.

## Overview

Shows total users, how many are managers, how many are salespeople, and how many accounts are currently deactivated.

## User Management

From the Users screen, a Super Admin can:

- Search and filter users by name, email, or role.
- Add a new user, specifying name, email, role, and optionally an employee ID and phone number. A temporary password is generated and shown once at creation - it should be shared with the user securely and not reused elsewhere.
- Edit an existing user's details.
- Deactivate an account to prevent login, or reactivate one later.
- Reset a user's password, which generates a new temporary password shown once.

> **Security:** *A temporary password is shown only once, at the moment it is generated. If it is lost before being shared with the user, generate a new one with Reset password rather than trying to recover the original.*

## 7. Frequently Asked Questions

### Why does a rule show zero flags?

This can mean the outlet data genuinely has no issues for that rule, or that the rule needs data that has not been uploaded yet (see section 4, “A note on data-dependent rules”). Rules that require monthly sales data or a second daily report will show a status of “skipped” with an explanation, rather than a hit count, until that data is available.

### Why did the outstanding balance not change after I marked a collection?

Collections recorded inside SalesGuard are tracked separately for performance reporting. The outstanding balance always reflects the FMCG company's own outstanding report and updates only on the next upload.

### I uploaded a file and the wrong report type was selected. What happens?

Daily outstanding files and monthly sales files use different column layouts. Selecting the wrong report type for a file will not load correctly - if this happens, re-select the correct report type and upload again.

### Can two locations be viewed together?

Yes. Selecting All locations in the location filter combines results from every location that has a completed rule check. Selecting one specific location restricts every screen to that location alone.

### Who can change rule thresholds?

Only Managers have access to the Configuration screen where thresholds are adjusted.

## 8. Glossary

| Term | Meaning |
|---|---|
| Outlet | A customer shop or business served by Avensons' salesmen. |
| Beat | A defined route or territory covering a set of outlets, normally serviced by one salesman. |
| Snapshot | One uploaded report, tied to a specific date, type (daily or monthly), and location. |
| Rule run | One completed evaluation of all enabled rules against a snapshot. |
| Overdue days | The number of days an invoice has remained unpaid past its due date. |
| DBN | Debit Note - typically raised for a bounced cheque or similar adjustment. |
| INV / OPN / CRN | Standard document types: Invoice, Opening balance, and Credit Note respectively. |
| Exposure | The total outstanding amount associated with a set of flagged records. |
